# Chapter 9-10 Confidence Intervals and Hypothesis Testing

HT for the Mean when  $\sigma$  is unknown

**Statistics** 

Mehmet Güray Güler, PhD

Last updated: 01.04.2020

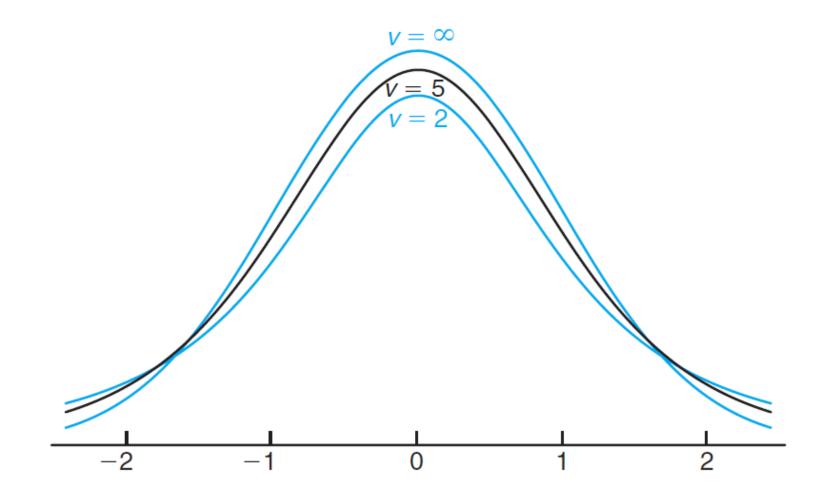

- The CLT is nice...
- However it was assumed that the population standard deviation is known.
- in many experimental scenarios, knowledge of  $\sigma$  is certainly no more reasonable than knowledge of the population mean  $\mu$
- As a result, a natural statistic to consider to deal with inferences on  $\mu$  is

$$\frac{\bar{X} - \mu}{S/\sqrt{n}}$$

• Let  $X_1, X_2, \ldots, X_n$  be independent RVs that are all normal with mean  $\mu$  and standard deviation  $\sigma$ . Let

$$\bar{X} = \frac{1}{n} \sum_{i=1}^{n} X_i$$
 and  $S^2 = \frac{1}{n-1} \sum_{i=1}^{n} (X_i - \bar{X})^2$ 

- Then the random variable  $T = \frac{\bar{X} \mu}{S/\sqrt{n}}$  has a t-distribution with v = n 1 degrees of freedom.
- We use t-distribution to infer information about the real mean  $\mu$

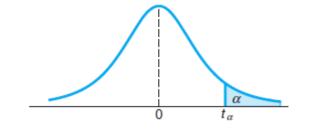

Table A.4 Critical Values of the t-Distribution

## HT for $\mu$ when $\sigma$ is UNknown

- The hypothesis are:
  - $H_0: \mu = \mu_0$
  - $H_1: \mu \neq \mu_0$
- The test statistic is given by:  $t_{obs} = \frac{\bar{x} \mu_0}{s/\sqrt{n}}$  with n=v-1 d.f.
- For a given  $\alpha$ ,
  - find  $t_{\alpha \setminus 2}$
  - calculate the observed t value  $t_{obs}$ .
  - Check whether observed  $t_{obs}$  lies in the critical region, i.e.,
    - $t_{obs} \ge t_{\alpha \setminus 2}$  or  $t_{obs} \le -t_{\alpha \setminus 2}$
  - If it is in the critical region, we reject the null hypothesis.

### HT Testing – Summary

- 1. State the null and alternative hypotheses.
- 2. Choose an appropriate test statistic
- 3. Establish the critical region using the significance level  $\alpha$
- 4. Calculate test statistic's observed value under  $H_0$
- 5. Reject  $H_0$  if the computed test statistic is in the critical region. Otherwise, do not reject.

- Example:
- We have the heights of 10 students from this class as:

171	175	156	151	179
175	170	164	167	162

Test

$$H_0$$
:  $\mu = 170$  vs  $H_1$ :  $\mu \neq 170$  for  $\alpha = 0.05$ 

- Solution:
- The average height turns out to be

$$\overline{X} = \frac{\sum_{i=1}^{n} X_i}{n} = 167$$

The sample standard deviation is

$$s^{2} = \frac{1}{n-1} \left( \sum_{i=1}^{n} X_{i}^{2} - n\bar{X}^{2} \right) \Rightarrow s = 8.87$$

#### **Solution:**

- For 9 d.f,  $t_{0.025} = 2.262$ .
- Hence rejection region is R- [-2.262, 2.262]
- Observed t is:
- $t_{obs} = \frac{\overline{x} \mu_0}{s/\sqrt{n}} = \frac{167 170}{8.87/\sqrt{10}} = -1.069$  which is outside of the rejection region
- Hence we do not reject  $H_0$
